UI / UX REQUIREMENTS

GOOGLE MAPS BUSINESS ANALYSIS

A design guide for a clear, easy-to-use business analysis dashboard and report.

Design principle: Make the data easy to find, compare, understand, and act on.

1. UI vs. UX

Term	Meaning	Application in this project
UI — User Interface	What the user sees and interacts with: layout, colours, buttons, tables, filters, labels, and charts.	Readable dashboard, clear filters, consistent colours, tidy tables, labelled charts.
UX — User Experience	How easy and useful the project feels to use, from finding information to understanding a result.	Simple navigation, logical workflow, useful search/filtering, understandable results, and clear recommendations.

2. Main User and Goal

Primary user: Project evaluator, student analyst, or a person reviewing local-business digital presence.

Main goal: Quickly identify businesses with no official website found, compare their digital presence, and understand which opportunities should be reviewed first.

3. Recommended Dashboard Layout

Section	What it should show
Top header	Project name, study area, collection date, and short purpose statement.
Summary cards	Total businesses researched; website found; website not found; unclear status.
Filter row	Locality, business category, website status, and rating/review-count range.
Main charts	Website status split; website status by category; businesses by locality.
Opportunity table	Business name, category, locality, rating, reviews, website status, score, and reason.
Recommendation area	Top findings, priority actions, assumptions, and limitations.
Footer/source note	Data collection date, source notes, and definition of 'website not found'.

4. UI Components and Behaviours

Component	Requirement
Search field	Search by business name or locality; show a clear empty-results message.
Filters	Use consistent dropdowns or slicers for category, locality, and website status.
Summary cards	Show number and percentage where useful; ensure totals match the dataset.
Charts	Use descriptive titles, labelled axes, readable legends, and non-misleading scales.
Data table	Use sortable columns, consistent number formats, and visible status labels.
Opportunity score	Display the score with a short reason; never show a score without the rubric.
Source / detail link	Where permitted, let the reviewer open the public listing or source reference.
Export action	Clearly label available exports, such as CSV/Excel or a report, only if implemented.

5. Visual Design System

Element	Guideline
Primary colour	Dark navy for headings and structure; teal for highlights and key actions.
Background	White or very light grey/blue for a clean, low-clutter workspace.
Typography	Use one readable sans-serif font family; establish consistent heading, body, and caption sizes.
Spacing	Group related controls and charts; leave enough space so the dashboard does not feel crowded.
Icons	Use simple, consistent icons only when they improve recognition; always pair important icons with text.
Status colours	Use labels plus colour. Do not rely on colour alone; maintain adequate contrast.
Charts	Prefer bar charts for comparisons and a doughnut chart for a small number of status categories.

6. UX Flow

Step	User action / expected experience
1. Open dashboard	Understand project, study area, and data collection date.
2. Review summary	See overall website-presence counts and percentages.
3. Filter dataset	Narrow results by locality, category, or website status.
4. Compare patterns	Use charts to spot categories or areas with more website gaps.
5. Review a business	Check its public details, website verification status, and evidence notes.
6. Read recommendation	Understand the suggested next step and why the business was prioritized.
7. Export / submit	Use only the export options that are actually available.

7. Accessibility and Usability Checklist

- Text and chart labels are readable at normal zoom and on a laptop screen.
- Text/background contrast is strong; colours are not the only way to identify status.
- Filters and buttons have clear names and predictable behaviour.
- Tables have clear column headings, and numbers use consistent formats.

- Charts include titles and legends; avoid 3D effects and clutter.
- The dashboard clearly distinguishes 'Not Found' from 'Unclear'.
- Empty, missing, or unavailable data is explained rather than silently hidden.
- The same colour and wording mean the same thing throughout the project.

8. Suggested Wireframe

GOOGLE MAPS BUSINESS ANALYSIS | Study area: [Locality] | Collected: [Date]

[Total Businesses] [Website Found] [Not Found] [Unclear]

Filters: [Category ▼] [Locality ▼] [Website Status ▼] [Search business...]

[Website Status Chart] [Website Status by Category Chart]

[Businesses by Locality Chart]

Priority Opportunities
[Business] [Category] [Rating] [Reviews] [Website Status] [Score] [Reason]

Key Insights & Recommendations
[Finding 1 and action] [Finding 2 and action]

Sources and limitations: public listing data; website status verified as of the collection date.

9. Definition of Done

- The dashboard has a clear title, study area, and collection date.
- Summary totals and percentages match the cleaned dataset.
- Filters work as intended and do not produce confusing results.
- Charts have titles, labels, and readable legends.
- The opportunity list shows evidence-based reasons, not only a score.
- Website status uses consistent wording: Found / Not Found / Unclear.
- The layout is readable, uncluttered, and ready for presentation or submission.

Important: This document specifies UI/UX requirements and a proposed layout. It does not mean an interactive dashboard has already been built. Confirm the instructor's required platform before implementation.
